# NEEV JAIN

neevj2006@gmail.com | (617) 650-9906 | linkedin.com/in/neevj2006 | github.com/neevj2006/ | neevjain.vercel.app/ | Boston, MA

## EDUCATION

**Boston University** Boston, MA
Bachelor of Science, Computer Engineering Expected Dec 2027
- Concentration: Machine Learning | GPA: 3.7/4.0 | Dean's List

## TECHNICAL SKILLS

**Languages:** Python, C++, C, TypeScript, JavaScript, SQL
**Machine Learning:** PyTorch, TensorFlow, scikit-learn, XGBoost, PyTorch Geometric, MLflow
**Methods:** Graph neural networks, feature engineering, model calibration, evaluation, hyperparameter tuning
**LLMs & Retrieval:** RAG, hybrid BM25/vector retrieval, retrieval evaluation, OpenAI API, Ollama, pgvector
**Engineering & Data:** FastAPI, Next.js, PostgreSQL, Redis, pandas, NumPy, Docker, AWS, Git, CI/CD

## EXPERIENCE

**Software Engineering Intern** May 2026 - Aug 2026
SportsExcitement Remote
- Built authenticated search, editable profiles, and a School Finder in Next.js for a pre-launch student-athlete platform.
- Implemented Express/Prisma mentorship APIs with database migrations, input validation, and pagination.
- Fixed login and OTP routing errors; added loading and error states across authenticated workflows.
- Added 43 Jest, React Testing Library, and Supertest tests covering authentication, profiles, and mentorship.

**AI & Machine Learning Intern** May 2025 - Apr 2026
SeamsFriendly Remote
- Built a Next.js/PostgreSQL OMS replacing Make and Google Sheets, cutting order-to-shipment time by 30%.
- Audited 71 Make scenarios and migrated retained OMS workflows to n8n, eliminating 60K Make operations/month.
- Integrated Shopify, Etsy, Typeform, and Gorgias webhooks with 17 jobs for sync, alerts, and risk projections.
- Built Claude agents to implement features, run visual tests, and verify storefront and OMS changes.

## PROJECTS

**FraudGraph** | Python, XGBoost, PyTorch Geometric, FastAPI, Next.js | Source Code
- Built temporal graph ML pipelines on 590,540 IEEE-CIS transactions with chronological training and evaluation splits.
- Benchmarked XGBoost and graph models; XGBoost achieved 0.1262 test-set AP and 33% precision at top 100 alerts.
- Assessed analyst-budget recall, fraud-value capture, calibration, and robustness across multiple random seeds.
- Built authenticated APIs and an investigator UI for alert ranking, shared-entity graphs, and auditable case exports.

**SpecGuard** | Python, FastAPI, Next.js, PostgreSQL/pgvector, OpenAI API | Source Code
- Built an LLM code-review platform that checks JavaScript/TypeScript pull requests against written requirements.
- Grounded model verdicts in source evidence using hybrid BM25/vector retrieval over AST-aware code chunks.
- Validated model quotes against committed source and abstained on invalid citations or unverifiable claims.
- Added editable review criteria, persisted review history, reviewer notes, and JSON exports for traceable analysis.

**F1 Race Forecasting System** | Python, scikit-learn, pandas, NumPy | Source Code
- Built a leakage-resistant pipeline across 81 races and 1,640 driver-race records, engineering 29 features.
- Predicted finishing order and win, podium, top-10, and DNF probabilities via 10,000 Monte Carlo simulations per race.
- Achieved 0.754 Spearman correlation and 2.84-position mean absolute error on five held-out 2026 races.
- Applied sigmoid calibration to win probabilities; retained raw simulation outputs for podium, top-10, and DNF odds.

**Gideon - Voice Assistant** | Python, Vosk, Ollama, SQLite | Source Code
- Built a local-first Windows voice assistant with offline Vosk speech recognition and an Android bridge.
- Integrated a quantized 1.5B-parameter local LLM with local, cloud, and automatic-fallback inference modes.
- Implemented deterministic command parsing and SQLite persistence to retain state across assistant sessions.
- Secured write actions with single-use confirmations and HMAC-SHA256 authentication for the phone bridge.
